

KDT System

Cargo VVVF. Platform controller

Adapted for control the most platforms types and lifts for diseased people, the KDT system is based on a conventional concept but incorporates modern electronics to cope with EMC/EMI rules, covering market requirements up to 8 stops.

The control panels based on this solution include the KDT plate (plus the expansion plate for over 5 stops) and the power elements depending on the model. The terminals/connectors layout reduces wires to a minimum and makes installation easier.

Despite the extreme simplicity of the KDT system, its reduced size, intense specialisation, available software options, electrical sturdiness and careful design of everything related to safety makes this system the candidate for resolving situations in which PLC or other electronic control systems prove inefficient, inadequate or even unsafe.
